

Week 8 Final Summary - Data Analytics Track

AnalystLab Africa Experience Lab | HealthConnect Clinic Project

What I Did This Week

Consolidated four weeks of analysis into a final, validated package: confirmed KPIs, finalized four key visualizations, refined business insights and recommendations, and wrote an executive summary for non-technical stakeholders. Also documented the complete final integration with the Data Science track, closing a full Test → Finding → Action → Retest → Validated Improvement cycle that began in Week 6.

Final Integration Outcome

The collaboration with Data Science moved from a one-directional suggestion (Week 6) to a genuine two-way exchange: my analytical findings were tested in a real model, the result (no recall improvement) was fed back to me, and I used it to refine my own reported confidence in the compounding-risk finding. Both tracks ended with a more accurate, jointly validated understanding than either had alone.

Looking Back Across the Project

- **Week 4:** Defined the problem, reviewed resources, identified 5 business questions and candidate KPIs.
- **Week 5:** Calculated and interpreted 5 KPIs, built the first visualizations, produced initial business insights.
- **Week 6:** Discovered the lead-time × prior-no-show compounding effect, revised the Week 5 reminder-channel conclusion, and began real collaboration with Data Science.
- **Week 7:** Independently validated all KPIs, corrected an overstated finding through testing, and received real-world confirmation from Data Science's model testing.
- **Week 8:** Finalized all findings into a coherent, professional package with an executive summary and complete integration record.

Key Takeaway

The most valuable outcome of this project wasn't any single statistic - it was learning to test my own conclusions rather than trust them at face value, and seeing that discipline validated through a real, evidence-based collaboration with another track.

Remaining Work Beyond This Project

- Findings would need re-validation against real (non-fictional) HealthConnect data before any operational use.
- A controlled test (e.g., A/B testing the lead-time-dependent reminder strategy) would be the natural next step to move from correlation to confirmed impact.
